PROJECT WORK SAMPLE | EDITED FOR RECRUITMENT
White Petrol
Industrial stream assessment and controlled pilot planning

Design challenge:

What evidence should an industrial team require before accepting a difficult hydrocarbon stream for testing, treatment or further development?

My documented design contribution:

I developed the White Petrol concept and structured its technical planning, feedstock assessment, pilot evaluation, governance and financial scenario documentation. The design connects sampling and compatibility requirements to treatment-route review, contaminant accountability and decisions to proceed, modify, hold, re-route or reject.

Selected work product structure:

Control point	Designed record or action	Review question
Stream admission	Source identity, sampling basis, chain of custody and classification	Is the material sufficiently characterised?
Compatibility	Route requirements, operational risks and safety review	Can controlled testing proceed?
Residual burden	Contaminant fate, mass balance, spent media and side-stream records	Where do contaminants and wastes go?
Pilot decision	Baseline, repeat testing, acceptance criteria and review record	Does evidence justify the next step?

Supporting work includes a technical architecture, risk register, evidence classification, pilot protocols, site requirements, financial scenarios and stakeholder review materials.

Why this matters to an employer:

Demonstrates multidisciplinary project definition, requirements coordination, risk management, pilot planning and preparation of reviewable decision records. Relevant to assignments coordinating technical specialists, laboratories, procurement, finance and environmental review.

Current evidence boundary:

Documented concept, system design and pilot planning. Completed industrial trials, verified treatment performance, regulatory approval and realised returns have not been established. Financial outputs are illustrative and require quotations and measured pilot evidence.
Representative design excerpt prepared for professional review. The table describes proposed controls and required records, not completed tests or operational results.
