PROJECT WORK SAMPLE | EDITED FOR RECRUITMENT
YWIG Sample Integrity Controls
Waste-stream traceability | Proposed operating SOP and pilot workflow

Design challenge:

How can sample identity and custody integrity be preserved across field collection, handovers, laboratory checks and eligibility decisions?

My documented design contribution:

I structured sample identification, custody transfer documentation, laboratory reconciliation, exception statuses and material-eligibility control points, with defined boundaries for licensed operators and laboratories.

Selected work product structure:

Control stage	Proposed record	Stop or check
Source and sample	Stream / site / unique sample ID	Unknown origin: hold
Custody transfer	Holder; handover time; seal state	Missing transfer: exception
Lab intake	Sample ID match; condition / receipt	Mismatch: quarantine
Qualification review	Test linkage; integrity / decision log	No evidence: no passport

Illustrative control logic distilled from the Chain-of-Custody and Sample Integrity SOP; not a claim that records were generated through a live waste operation.

Why this matters to an employer:

Relevant to consulting support for waste-programme planning, field SOPs, project coordination, quality controls and licensed-partner interfaces.

Current evidence boundary:

Technical and operational documentation is available. No proof of licensed waste operations, commissioned hardware, laboratory certification or commercial material offtake is presented.
Representative excerpt recreated from the project documentation for professional review. It is not a live system screenshot, an operational record, a certification or an independent verification.
