PROJECT WORK SAMPLE | EDITED FOR RECRUITMENT
Talent Exchange
TSX and TMX | Workforce intelligence and talent exchange concepts

Design challenge:

How could institutions connect workforce capabilities with sector needs and international opportunities through a structured talent exchange framework?

My documented design contribution:

I developed the strategic concept and a phased development model linking workforce mapping, sector demand, institutional partnerships and potential cross-border talent opportunities.

Proposed project structure:

Design element	Proposed scope	Development requirement
TSX multisector pathway	Skills intelligence and workforce mapping across sectors	Define users, data needs and assessment methods
TMX healthcare pathway	Healthcare-focused talent exchange concept	Specify credentials, partner roles and participation requirements
Partnership activation	Cross-border institutional cooperation and potential placement pathways	Confirm partners and sector-specific conditions
Phased development	Workforce mapping, partnership activation, then wider exchange	Test a bounded workflow before expanding

The TSX concept proposes applications in healthcare, artificial intelligence, climate and other strategic sectors. TMX is presented as the healthcare-focused direction; its detailed operating model requires separate development.

Professional relevance:

Demonstrates strategic project development, stakeholder mapping, programme structuring and cross-border coordination planning.

Current evidence boundary:

Concept and strategic planning. A functioning platform, validated AI models, signed institutional partnerships and completed placements have not been established by the available project material. This sample presents a proposed development framework. It does not represent operational records, verified placement outcomes or an implemented workforce system.
