G-Shale

PROJECT WORK SAMPLE | EDITED FOR RECRUITMENT
Green Shale Platform
Material qualification and industrial validation planning

Design challenge:

What evidence is needed to move a specific shale-derived or associated mineral material from technical potential to a qualified industrial application?

My documented design contribution:

I developed the project concept and structured its application pathways, phased implementation, validation requirements, governance and commercial screening. I connected material identity, sampling, laboratory evidence, environmental assessment, product qualification and buyer requirements to decisions to advance, redesign, hold or stop.

Selected work product structure:

Control point	Designed record or action	Review question
Material identity	Source, process history, sample ID and chain of custody	Which material does the evidence represent?
Characterisation	Composition, variability, environmental behaviour and test records	Is the stream suitable for further evaluation?
Qualification	Application tests, applicable requirements and repeatability	Does it meet the intended application criteria?
Advancement	Pilot evidence, buyer requirements, cost assumptions and review record	Should the pathway advance, change or stop?

Proposed pathways include GreenCem, ZeoWater, AmmoniaGuard, shale adsorbents, EcoBoard and Carbon Pavers. Each requires separate material evidence and application-specific validation.

Why this matters to an employer:

Demonstrates multidisciplinary programme design, research synthesis, requirements coordination, pilot planning and risk management. Relevant to work linking technical specialists, laboratories, suppliers and prospective users through reviewable evidence and decisions.

Current evidence boundary:

Documented concept, architecture and validation planning. External research informs test design but does not establish Green Shale-specific performance. Completed industrial qualification, certified products, confirmed offtake, realised returns and carbon-credit eligibility have not been established. Representative design excerpt prepared for professional review. The table describes proposed controls and required records, not completed laboratory tests or pilot results.
