PROJECT WORK SAMPLE | EDITED FOR RECRUITMENT
Personal Data Bank
Central Bank of Personal Data | Institutional design and governance concept

Design challenge:

How could an institutional framework connect individual control over personal data with governance, controlled licensing and economic valuation?

My documented design contribution:

I developed the project concept, executive summaries and a proposed dual leadership model. I also prepared an exploratory table linking data categories, potential uses and illustrative values in JOD and USD.

Proposed institutional structure:

Design area	Proposed component	Further work required
Institutional leadership	Sovereign Chief Data Officer and Sovereign Chief Banking Architect	Define mandates, authority and accountability
Individual control	Dashboards for access, permissions and licensing choices	Specify rights, permitted uses and review processes
Data infrastructure	Secure infrastructure and proposed privacy technologies	Assess architecture, security and technical feasibility
Economic valuation	Draft categories, use cases and indicative values	Define pricing units, methodology, currency treatment and evidence

The valuation table is an exploratory design artifact. Its figures are assumptions, not validated market prices or an approved exchange rate. Proposed data-backed financial instruments remain conceptual.

Professional relevance:

Demonstrates institutional concept development, governance planning, executive communication and coordination of policy, technology and economic requirements.

Current evidence boundary:

Concept development and institutional design. An operating bank, regulatory approval, verified legal compliance, implemented infrastructure and issued financial instruments have not been established. Prepared from the concept paper, executive summaries and draft valuation table. The components describe a proposed institution and do not represent operational results or confirmed partnerships.
