PROJECT WORK SAMPLE | EDITED FOR RECRUITMENT
Digital Karma
Institutional performance and accountability concept

Design challenge:

How could institutions use operational evidence and more frequent performance reviews to identify service issues and support accountable management decisions?

My documented design contribution:

I developed the project concept and executive summary, explored an institutional Digital Trust Score, and communicated the idea through LinkedIn posts and outreach to a civil society organisation.

Proposed project structure:

Concept element	Proposed function	Further work required
Institutional data	Connect selected operational data sources	Confirm access, data quality and integration feasibility
Performance analysis	Track indicators, changes and trends	Define measures, reporting periods and analytical methods
Digital Trust Score	Summarise selected institutional performance dimensions	Develop and test weights, methodology and review procedures
Management reporting	Provide a central dashboard for authorised reviewers	Specify users, responsibilities and decision workflows

The concept concerns institutional performance. Its proposed scoring approach requires transparent definitions, suitable evidence and review procedures before it can support decisions.

Professional relevance:

Demonstrates concept development, performance-framework planning, executive communication and stakeholder outreach.

Current evidence boundary:

Concept development and stakeholder outreach. A deployed system, working government integrations, validated scoring methodology and measured predictive accuracy have not been established.
This sample describes intended capabilities and development requirements. Public communication and outreach do not establish institutional endorsement, partnership or implementation.
