Carbon MRV

PROJECT WORK SAMPLE | EDITED FOR RECRUITMENT
Carbon Footprint MRV
Evidence-linked Scope 1 & 2 reporting | Functional demo / synthetic data

Design challenge:

How can an organisation avoid treating a calculated emissions number as a reportable number before source evidence, factor versions and reviewer controls have passed review?

My documented design contribution:

I structured a traceable sequence connecting source activity, evidence, calculation inputs, QA/QC flags, review authority and reporting status. I also prepared controlled test scenarios and expected outcomes for a reviewer-led demo.

Selected work product structure:

Control point	Designed record or action	Review question
Source activity	Site / period / activity / source document	Can the result be traced back to evidence?
Factor governance	Versioned emissions factor and applicability	Which factor was used, and why?
QA/QC gate	Flags, missing evidence and exceptions	Should the record be held or corrected?
Authorised review	Decision, assigned role and audit trail	Who approved the reporting status?

The source dossier also includes a Committee Evaluation Guide with reference scenarios, expected behaviour and explicit prototype limitations.

Carbon MRV

Why this matters to an employer:

Useful in consulting assignments requiring data registers, client evidence follow-up, exception management and defensible reporting processes.

Current evidence boundary:

Synthetic demonstration environment documented. Independent assurance, live client deployment and certification have not been established.
Representative excerpt recreated from the project documentation for professional review. It is not a live system screenshot, an operational record, a certification or an independent verification.
