PROJECT WORK SAMPLE | EDITED FOR RECRUITMENT
GIG Coordinate Evidence Card
Geospatial evidence-to-decision documentation
Designed template, not a field record

Design challenge:

How can a team convert dispersed environmental, water, terrain and asset observations into a traceable site-level action recommendation?

My documented design contribution:

I defined a Coordinate Evidence Card structure connecting the location context, evidence provenance, uncertainty, missing checks and decision authority, supported by governance and pilot-planning documents.

Selected work product structure:

Card section	Illustrative field set	Management function
Location context	Coordinate reference; asset / site context	One location-based case record
Evidence	Observed signal; source/date; source quality	Provenance and consistency
Uncertainty	Data gaps; confidence / validation needs	Transparency before action
Decision	Watch / Verify / Intervene / Escalate; owner	Accountable follow-up and escalation

No real coordinates, risk scores or field results are supplied in this recruitment-only excerpt.

Why this matters to an employer:

Relevant to environmental and infrastructure consultancy teams coordinating multidisciplinary field review, data quality, site inspection prioritisation and management escalation.

Current evidence boundary:

A documented conceptual and technical design, with a proposed pilot. Real-world predictive performance, engineering validation and completed site deployment are not established.
Representative excerpt recreated from the project documentation for professional review. It is not a live system screenshot, an operational record, a certification or an independent verification.
